National Survey on Drug Use and Health (NSDUH)

Target population:

Civilian, non-institutionalized population 12 and older

- Households (HHs) and
- Non-institutional group quarters (GQs)

Data collected quarterly in all 50 states and DC

- 7,200 local areas known as *segments*
- 140,000 screenings and 67,500 interviews completed annually

Field Enumeration (FE) for the NSDUH

- Frame construction requires field staff to completely enumerate a local area or *segment*
- Coverage supplemented during screening process

Costs Associated with Field Enumeration (FE)

- Lister training and field work
- Map production
- Field support during listing
- Processing of listing data
- Half-open interval

Address-Based Sampling (ABS)

Pros:

- Less costly
- Faster
- Enables larger segments

Con:

- Undercoverage in:
 - rural areas
 - group quarters

Costs Associated with Address-Based Sampling (ABS)

- Purchase of address lists
- Map production
- Implementation of the CHUM:
 - Interviewer training and field labor
 - Field support

NSDUH Field Study

Objective:

Develop and test an ABS/FE hybrid frame that provides cost savings without sacrificing coverage.

Evaluation factors:

- Changes in coverage
- Cost savings

Field Study Implementation

- Subsampled 200 NSDUH segments
- Matched SDUs to ABS Frame to estimate actual coverage
- Used field staff to aid matching

$$\text{Actual Segment Coverage} = \frac{\text{Matched SDUs}}{\text{Total SDUs}}$$

Predicted Segment Coverage

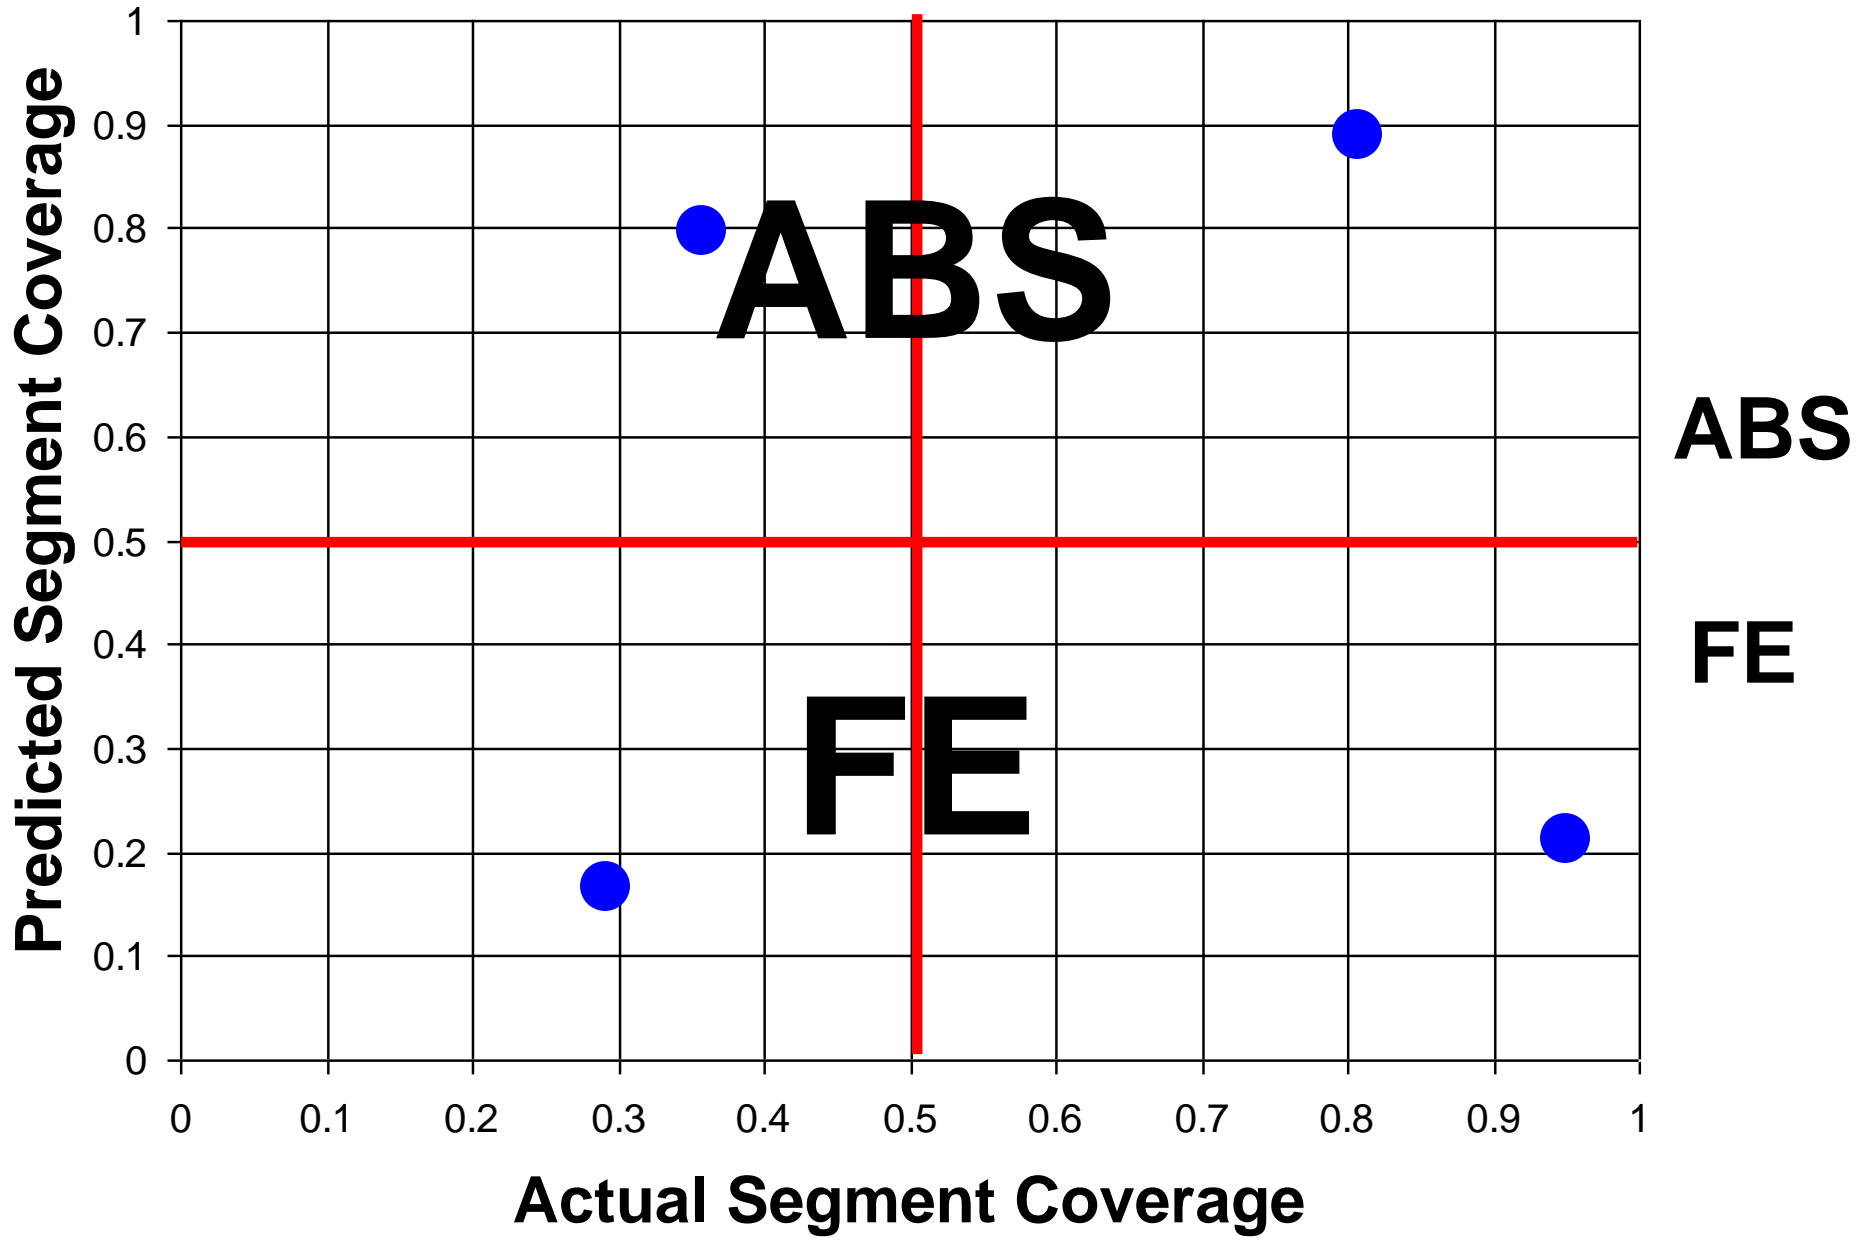

$$\text{Predicted Segment Coverage} = \frac{\text{\# Locatable Addresses}}{(\text{\# HH} + \text{\# GQ})}$$

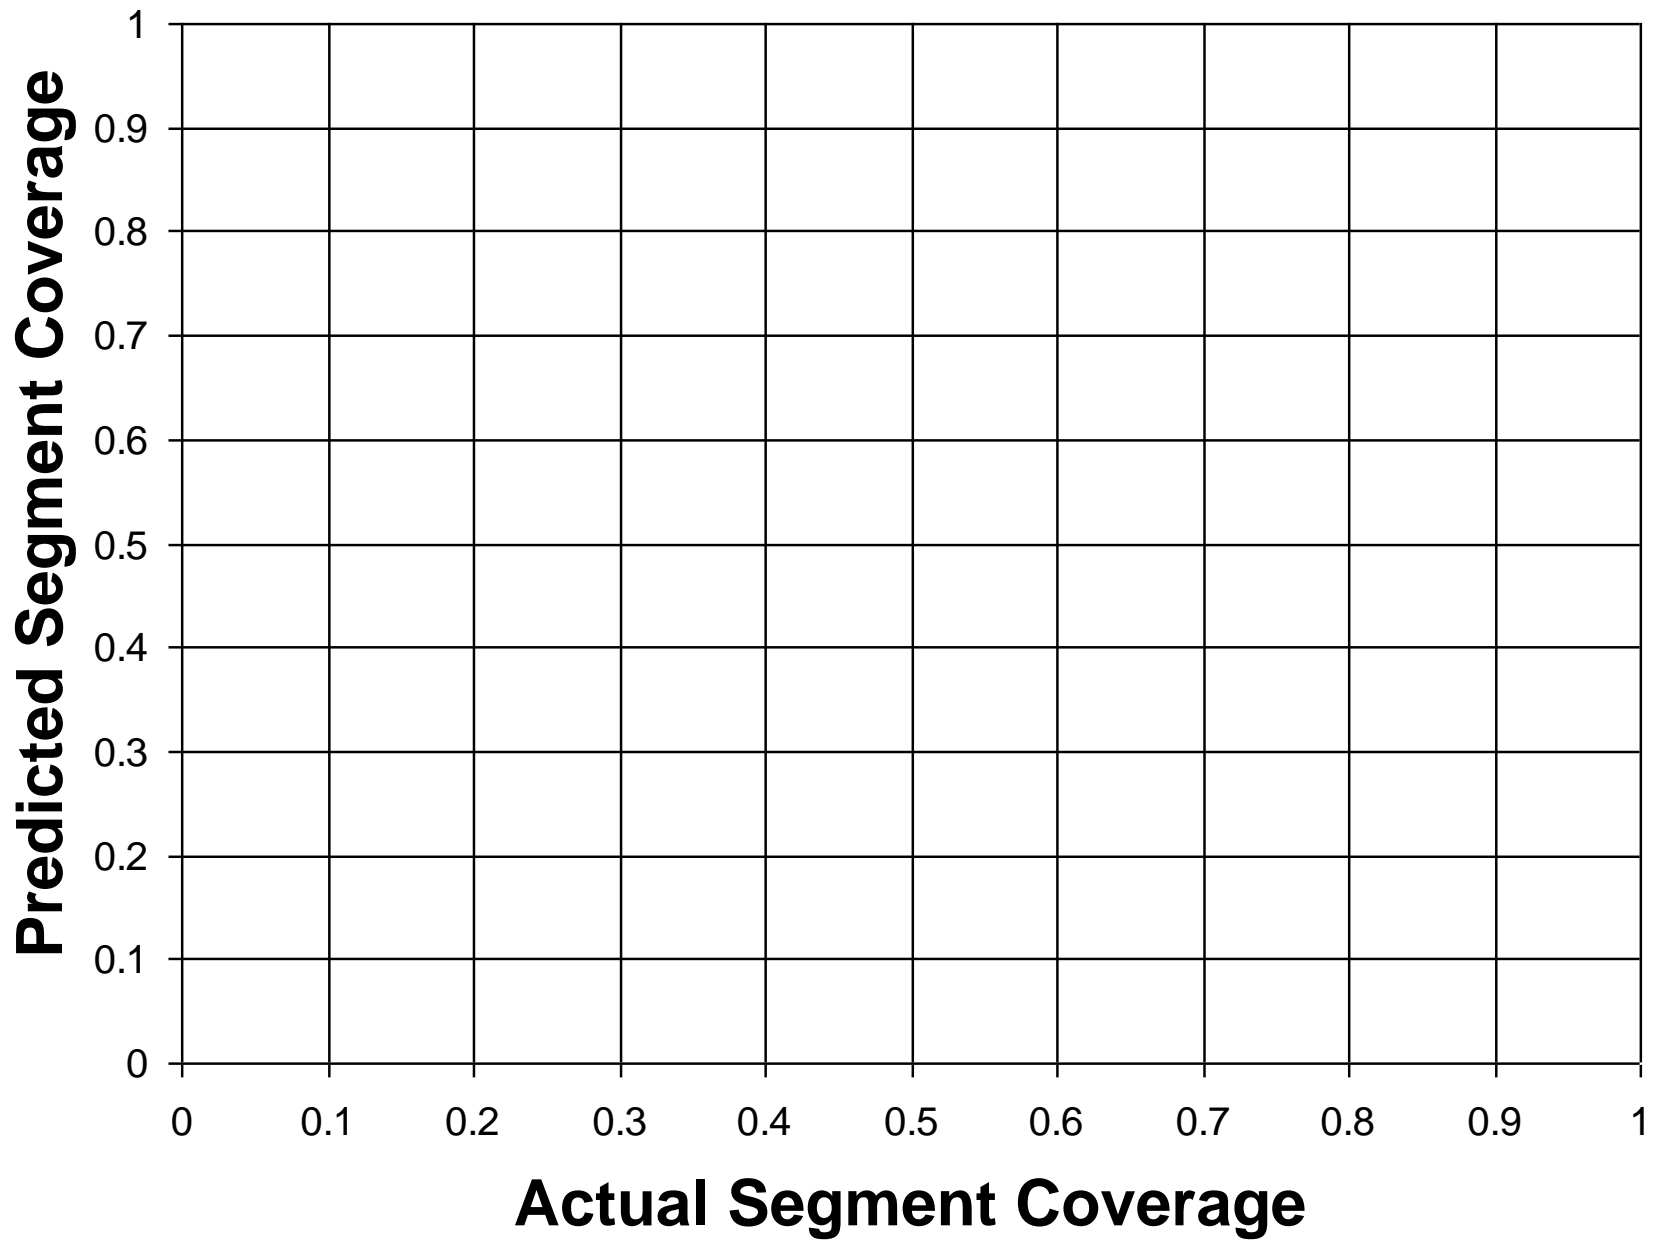

Sources of Inaccurate Predictions

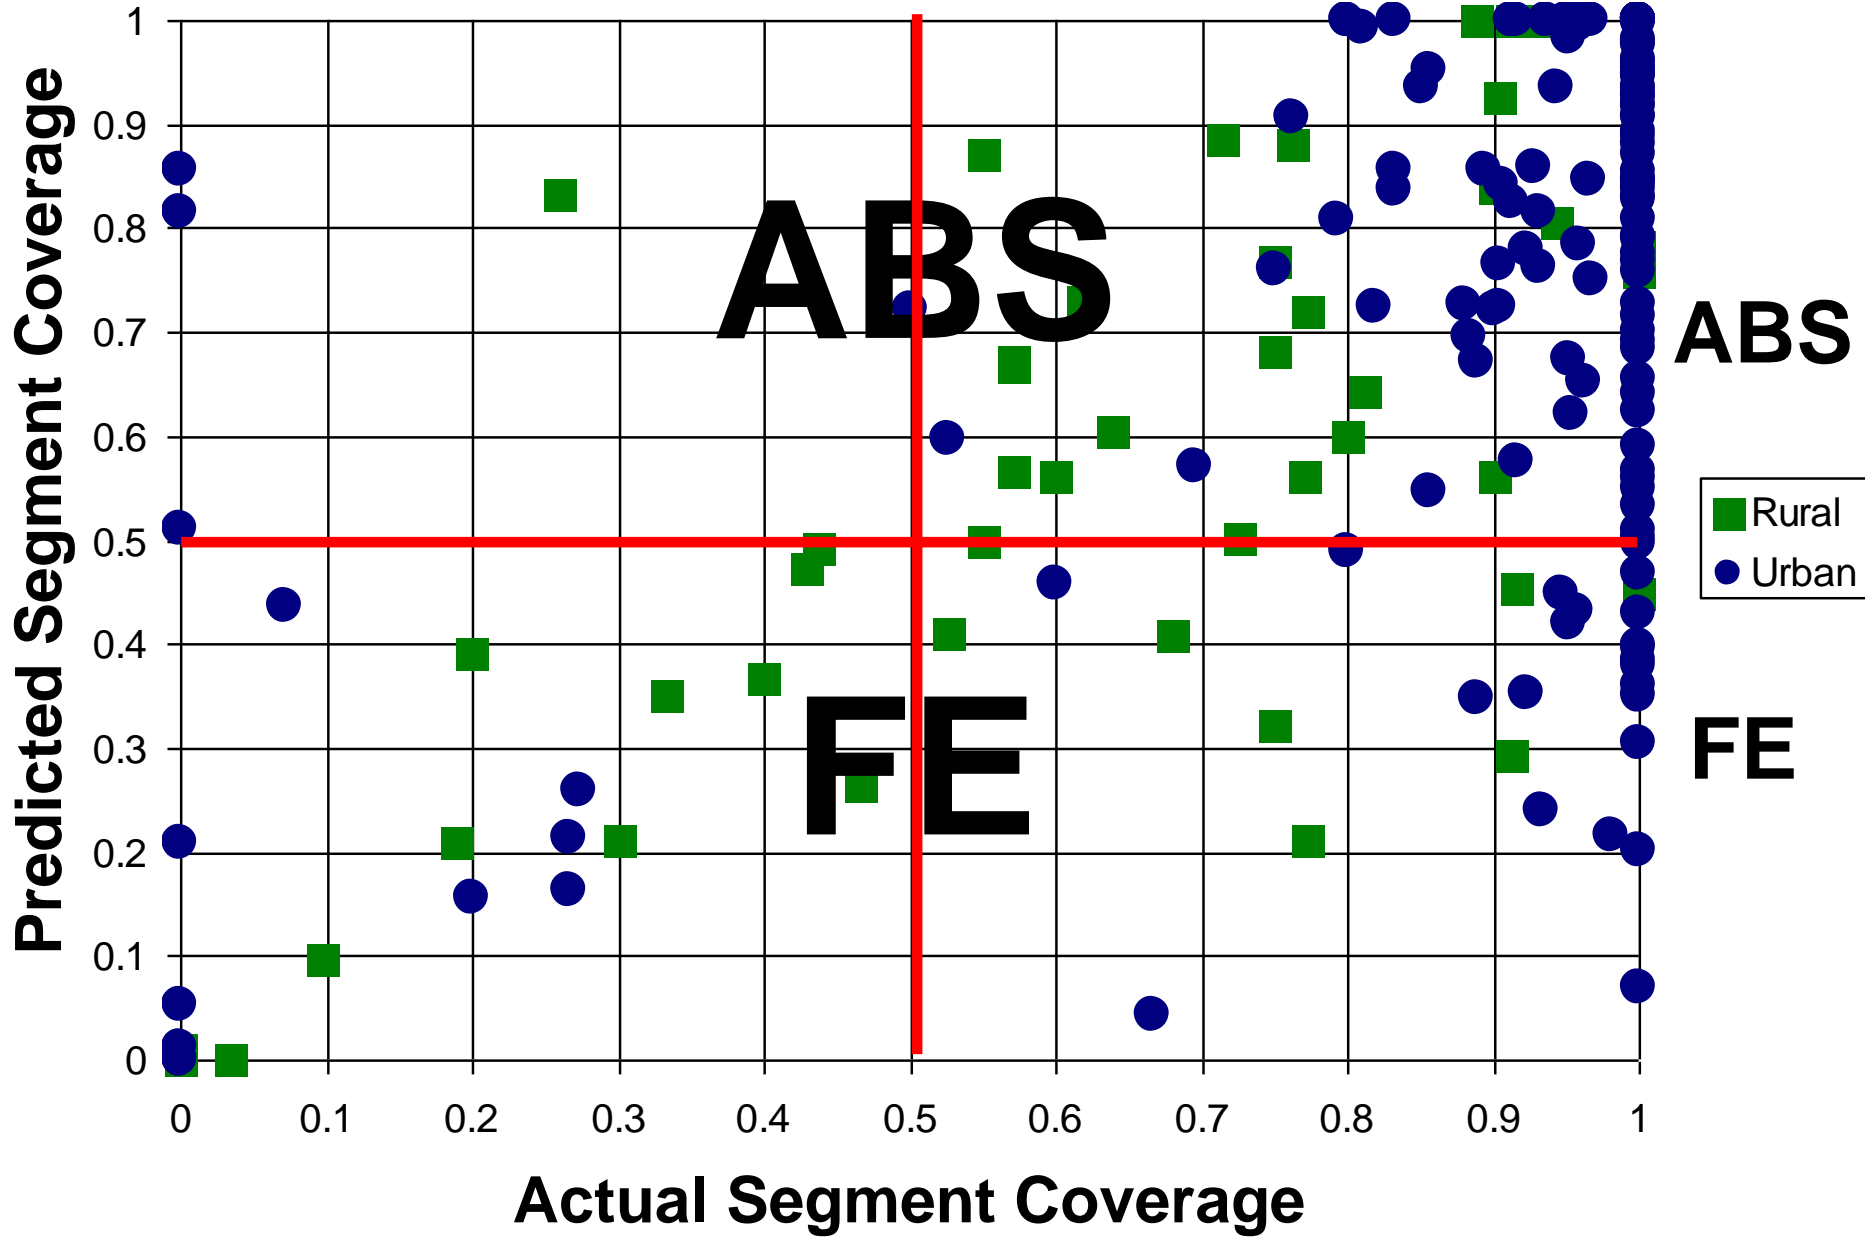

- # Locatable Adds
 - Geocoding error
- #HHs + #GQs
 - Estimates out of date
 - High growth/High decline areas

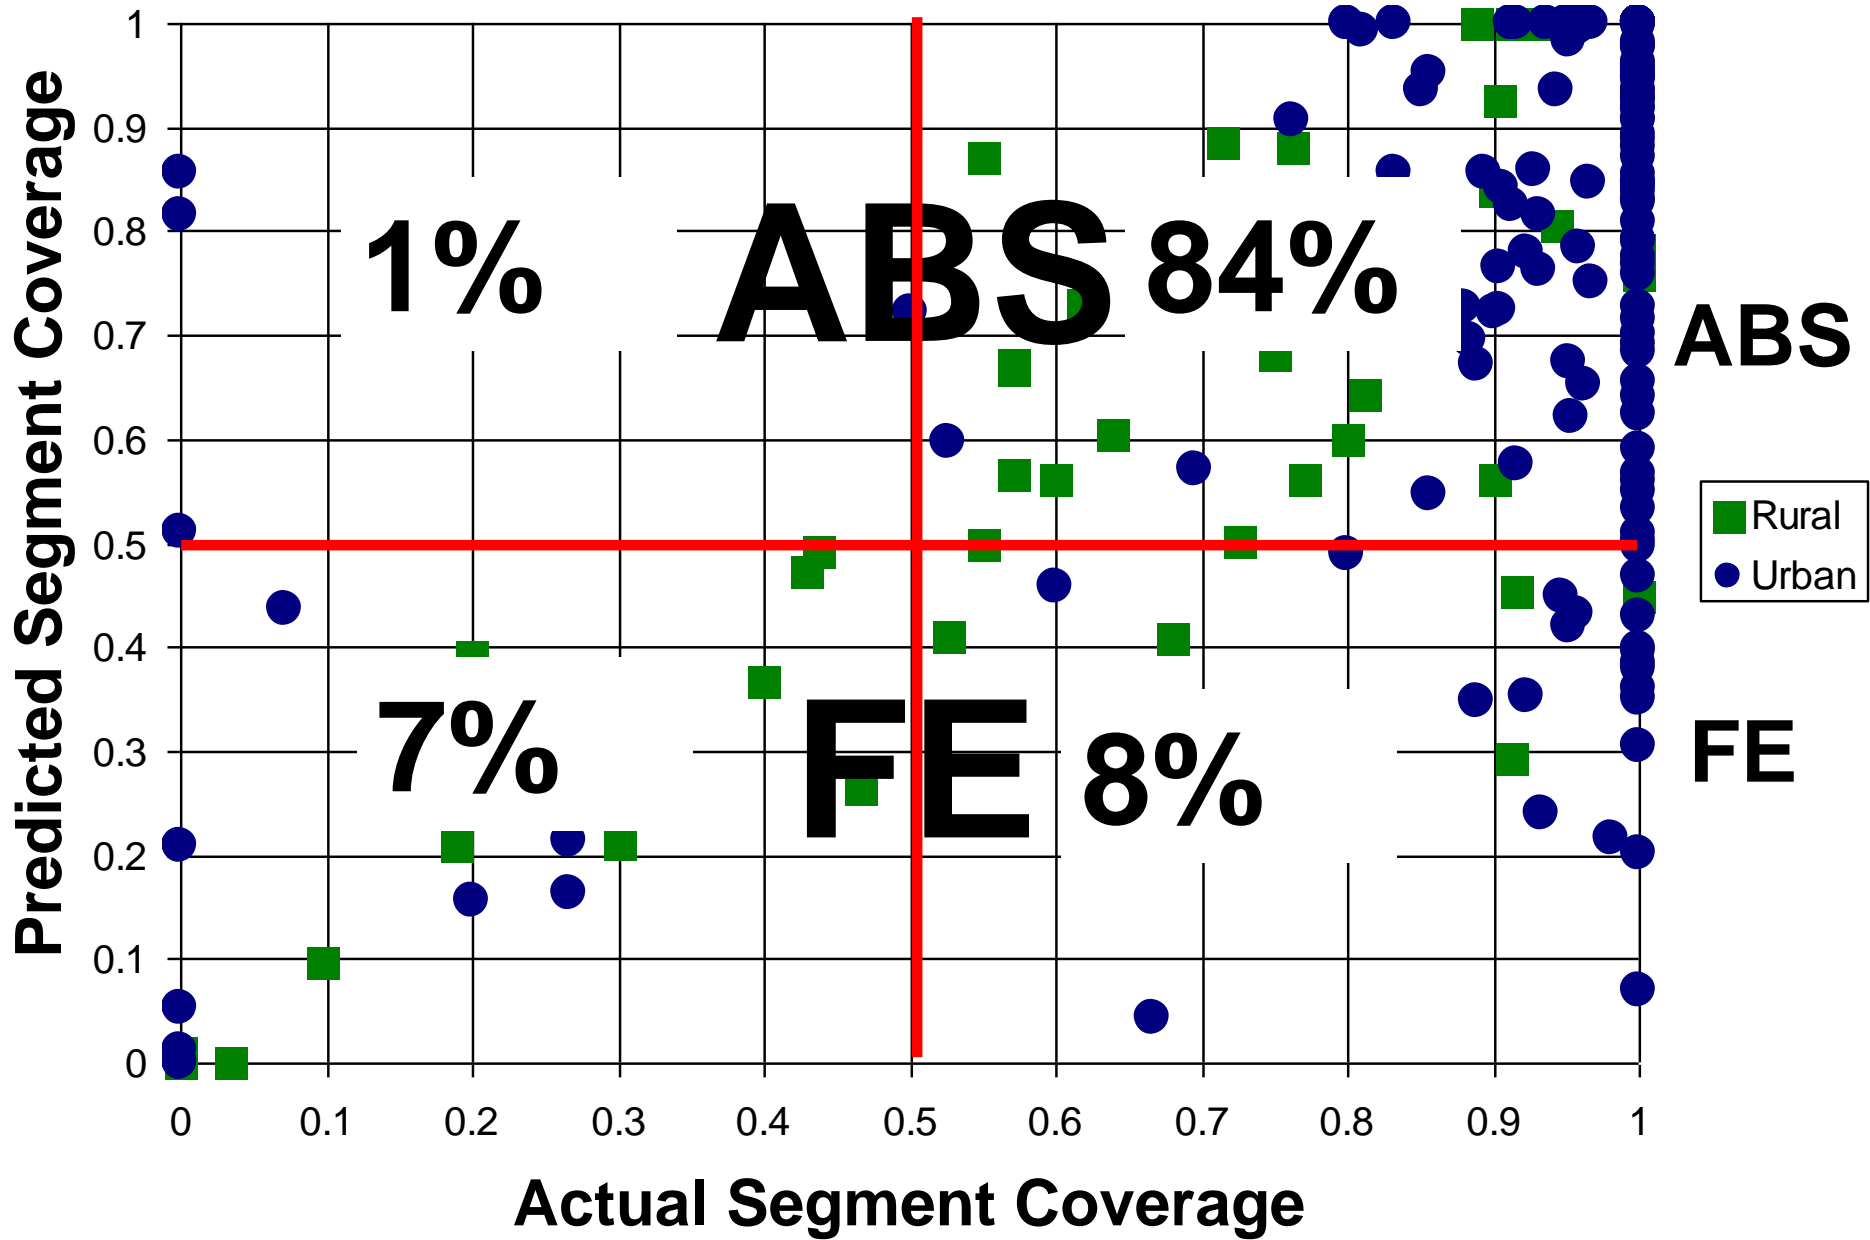

Implications of Inaccurate Predictions

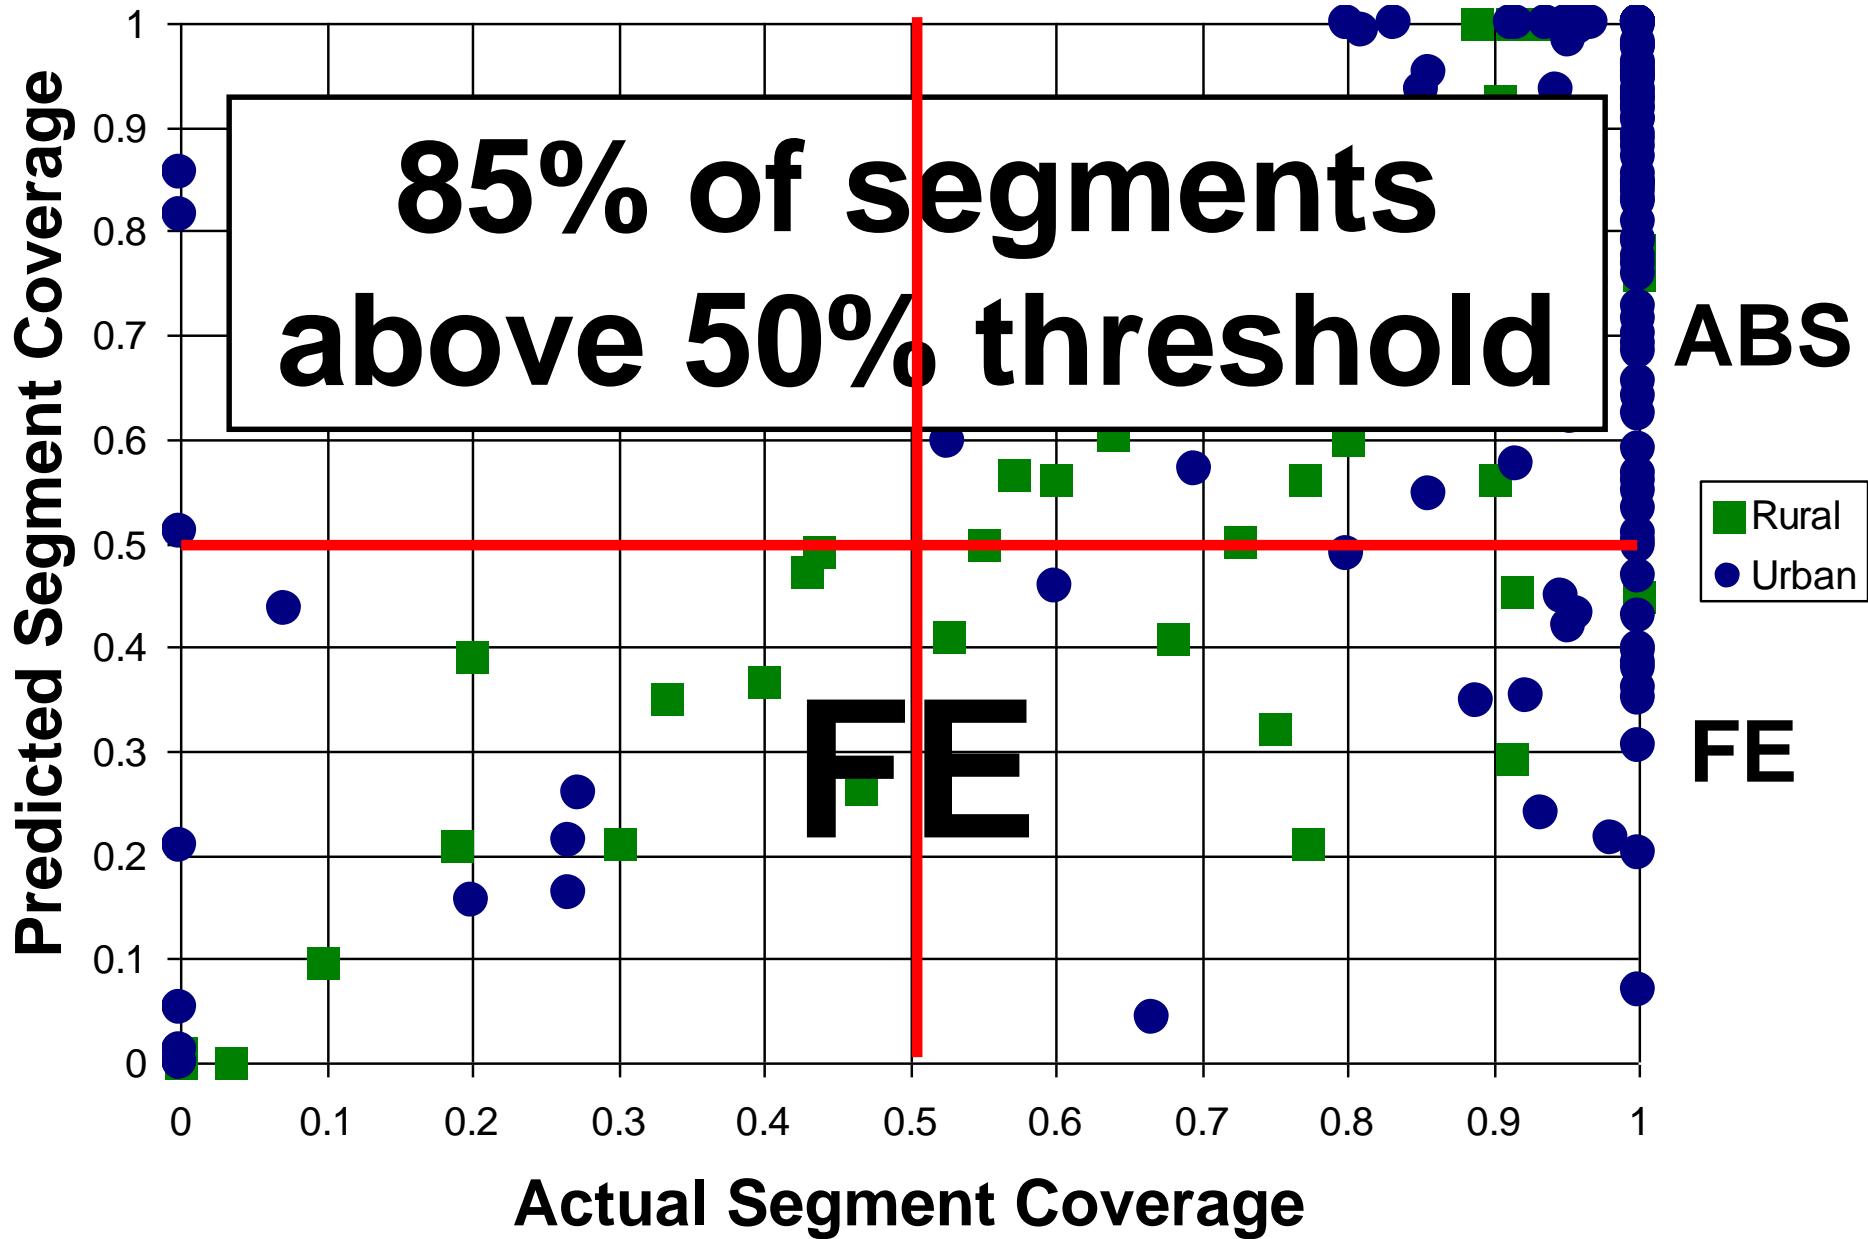

- Using ABS when should use FE
 - Loss in coverage
 - Unnecessarily increases costs
- Using FE when should use ABS
 - Unnecessarily increases costs

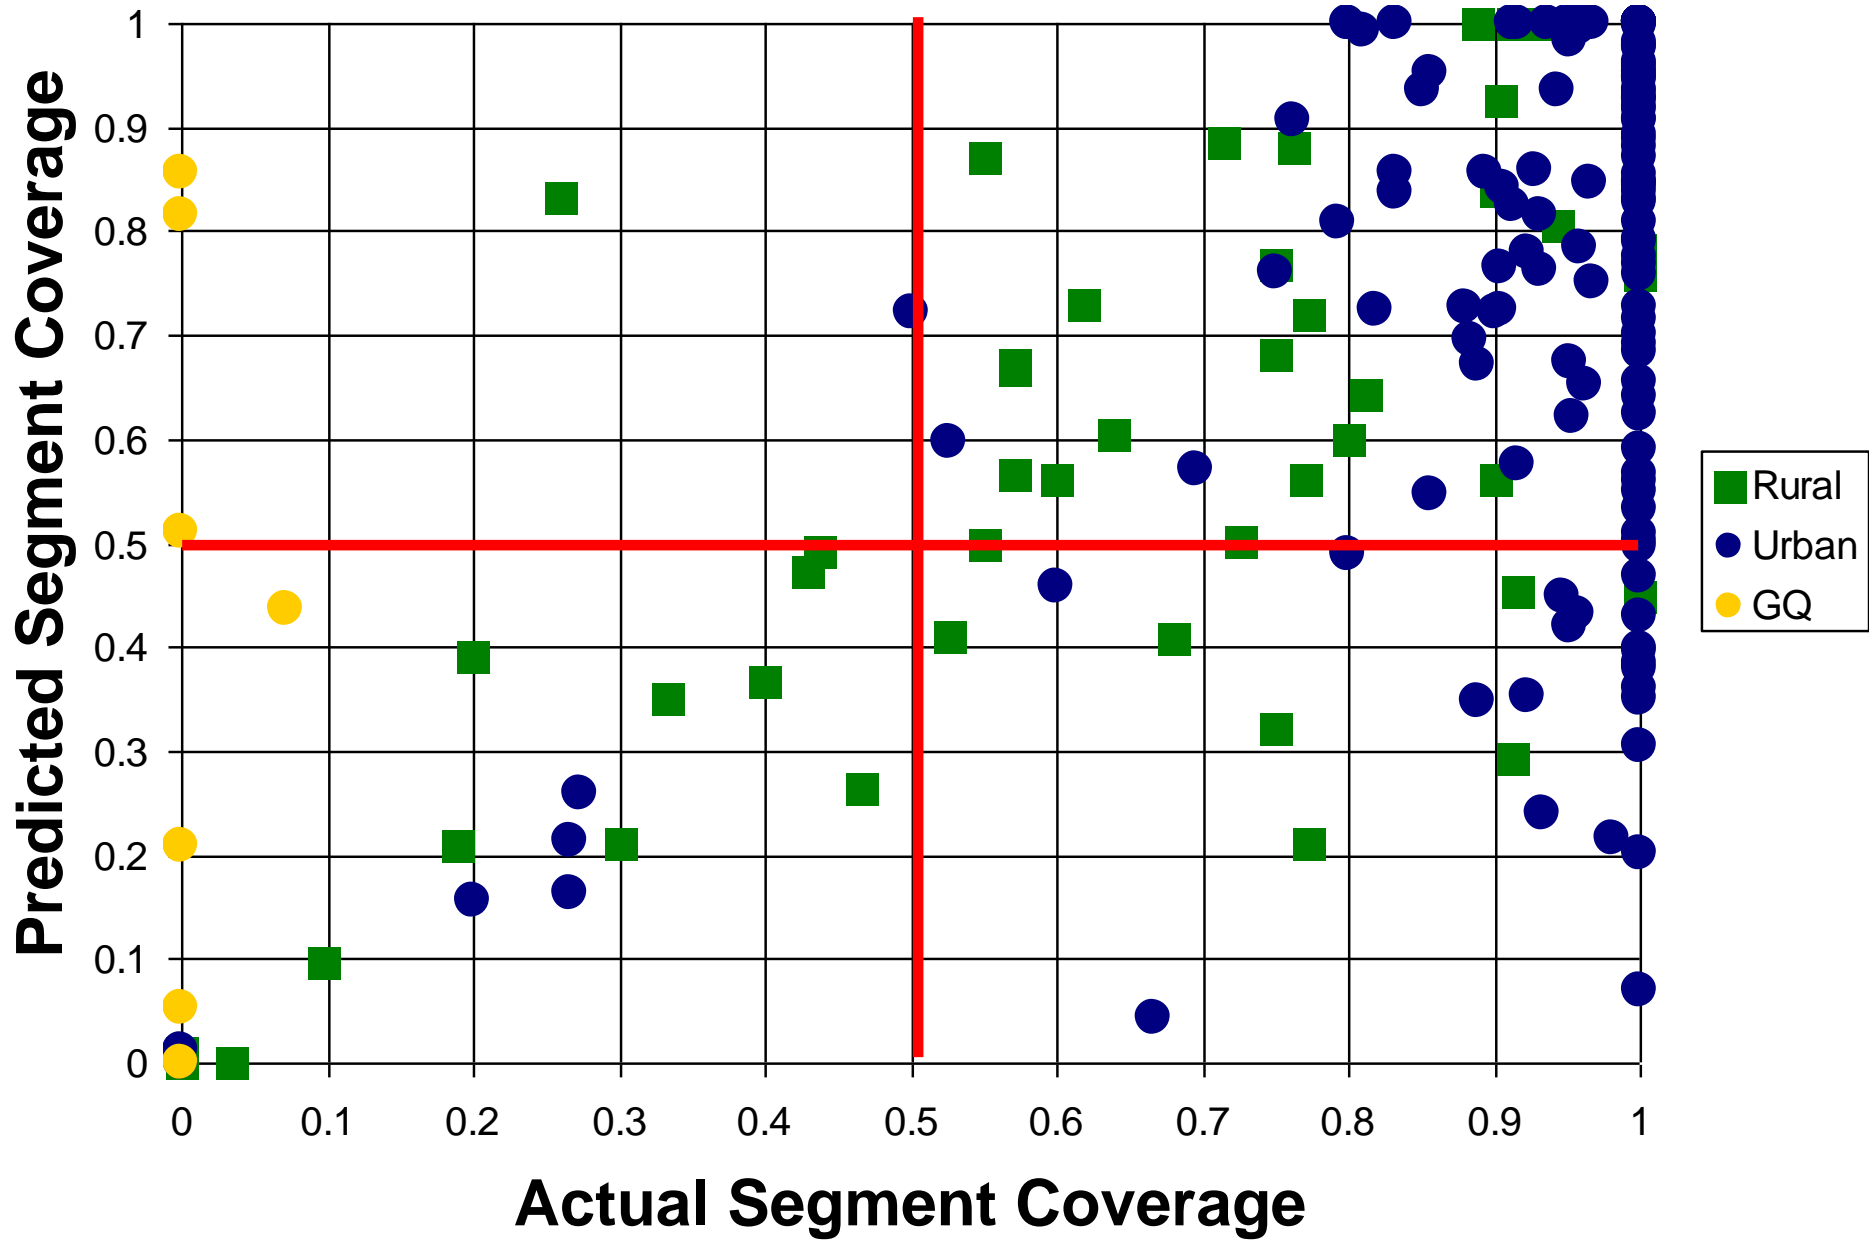

Conclusions

Improving coverage prediction will:

- **Further decrease costs**
 - ABS where appropriate
 - Reduce field burden
- **Increase coverage**
 - FE where appropriate
 - Reduce field burden
